

A scatter plot on a 10x10 grid. The grid is defined by light gray lines. There are 40 data points, each represented by a small open circle with a black outline. The points are distributed across the grid, with a higher density in the center and fewer points towards the edges. The points are scattered in a way that suggests a random distribution, but with a slight concentration in the central area. The points are located at various intersections of the grid lines, representing discrete data points in a 2D space. The overall pattern shows a higher frequency of points in the central region, with a gradual decrease in frequency towards the corners and edges of the grid.
